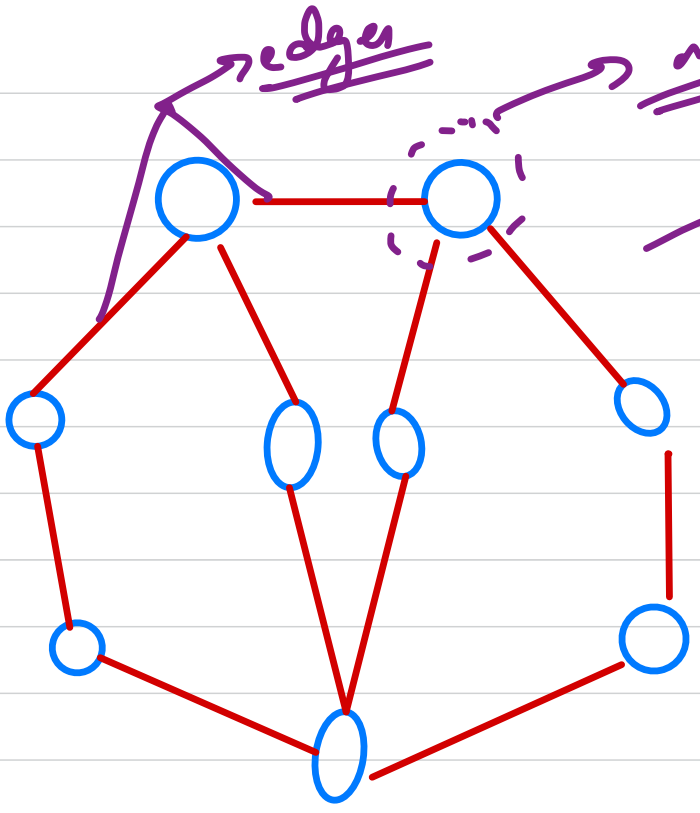
Graphs

Graph is a collection of nodes and edges, where each node might point to / connected to other nodes. The nodes represent real life entities and are connected by edges representing relationship between the nodes.



A typical graph

Biology → metabolic networks
Biology → PPI (Protein Protein Interaction)

Electrical → Circuit Organization

CSE → shortest path
CSE → Routing algo
CSE → graph dbs

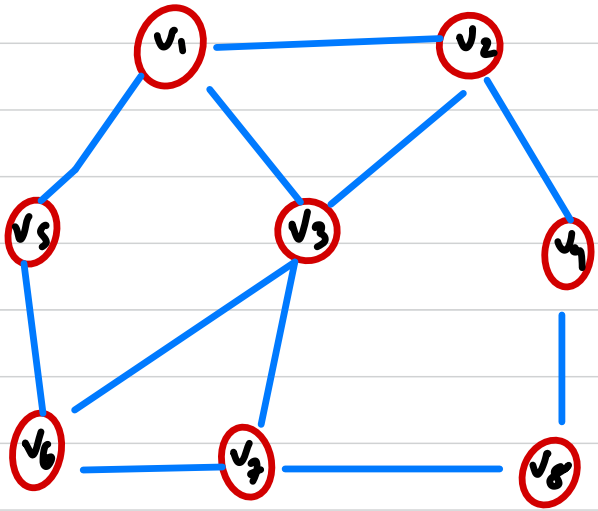
formal definition of graph :

$V = \{v_1, v_2, v_3, v_4, \ldots, v_8\}$

$E = \{\{v_1, v_2\}$
$\{v_2, v_4\}$
$\{v_2, v_3\}$
$\vdots$
$\}$

edges pairs unordered



8 vertices
11 edges

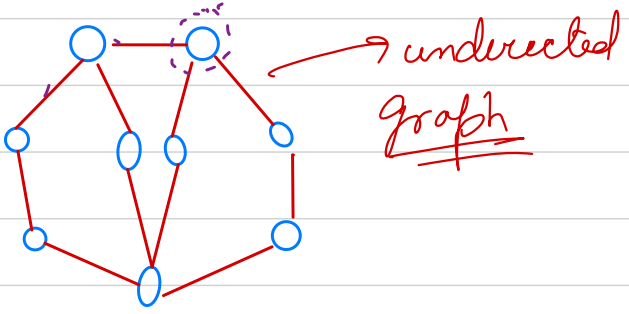
$\rightarrow G = (V, E) \rightarrow$

mathematical notation of a graph

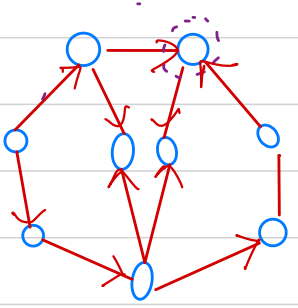
A graph G is an ordered pair of a set V vertices & E, a set of edges.

Types of graph :

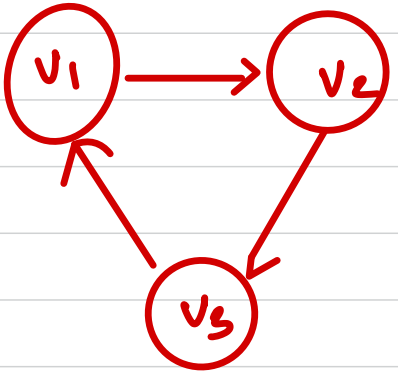
1. Undirected → Facebook
2. Directed → Instagram, Twitter



→ undirected graph



→ Directed graph



$G = (V, E)$

$E = \{ \{v_1, v_2\}$

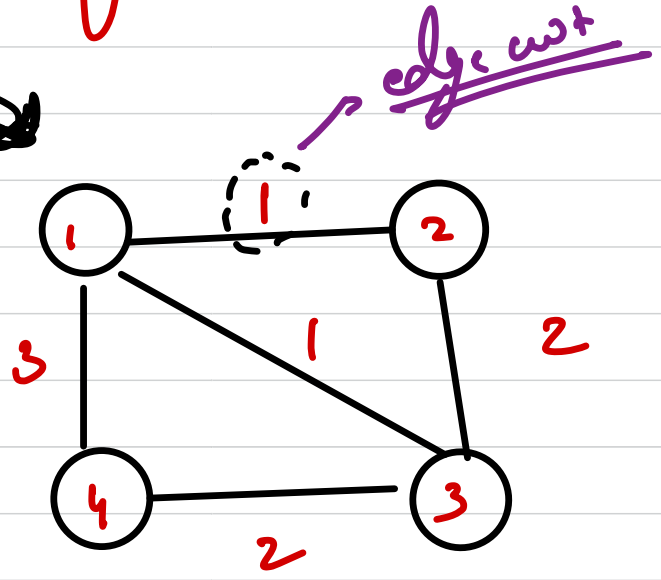
$\{v_2, v_3\}$

$\{v_3, v_1\} \}$

set of ordered pairs

Based on edge property

1. Weighted
2. Unweighted



Based on no. of edges

1. Sparse
2. Dense

Graph data structure →

↳ It is a non-linear data structure, Graph is a collection of nodes and edges, where each node might point to / connected to other nodes. The nodes represent real life entities and are connected by edges representing relationship between the nodes.

Representation of graphs :

(1) Adjacency Matrix

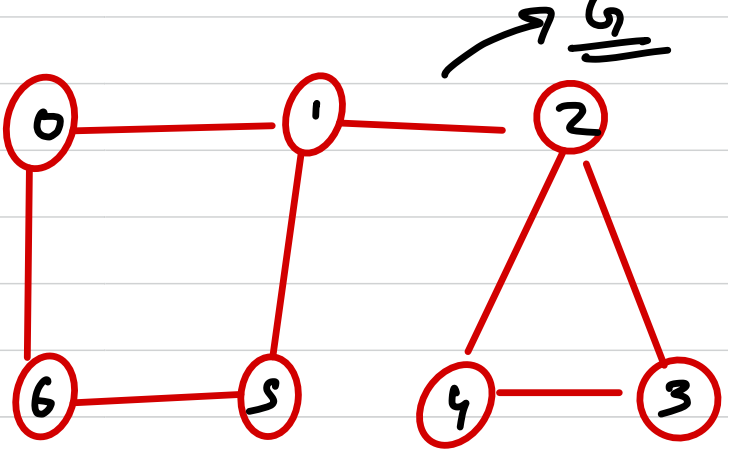
(2) Adjacency List ⟶ Adjacency Map

(3) Incidence Matrix

↳ edge List

Adjacency Matrix

$A_{ij} = \begin{cases} 1 & \text{if there is an edge from } i \text{ to } j \\ 0 & \text{else} \end{cases}$



A =

	0	1	2	3	4	5	6
0		1					1
1	1		1			1	
2		1		1	1		
3			1		1		
4			1	1			
5		1					1
6	1					1	

$V \times V$

→ $O(V^2)$

$(V \times V) \rightarrow$ dimension

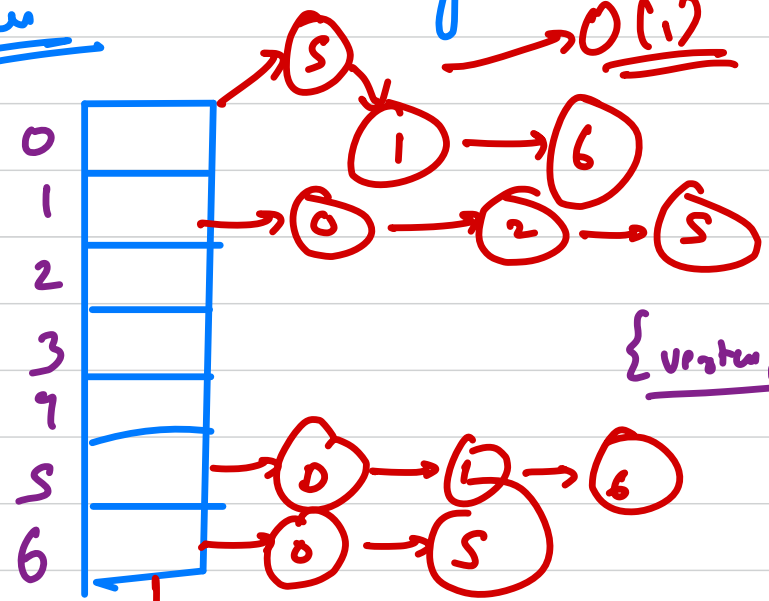
$|V| \Rightarrow$ no of vertices

Adjacency list

Array of LL → space optim

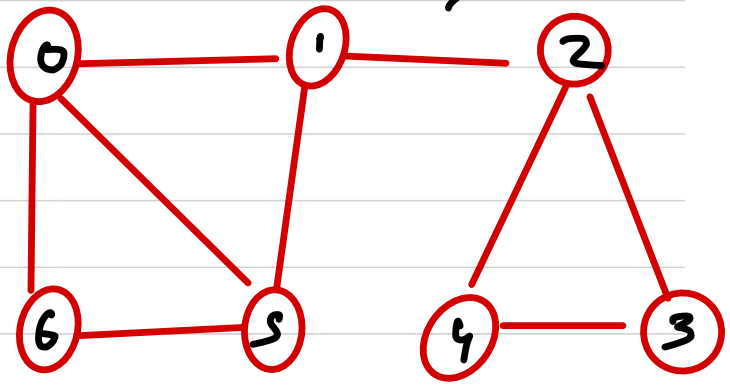
Array → vertex

LL → edges



add at head

good for sparse G



{vertex, wt} → node

$(V + 2E) \approx O(V+E)$

→ ith index store info about ith edge

adjacency map

↓

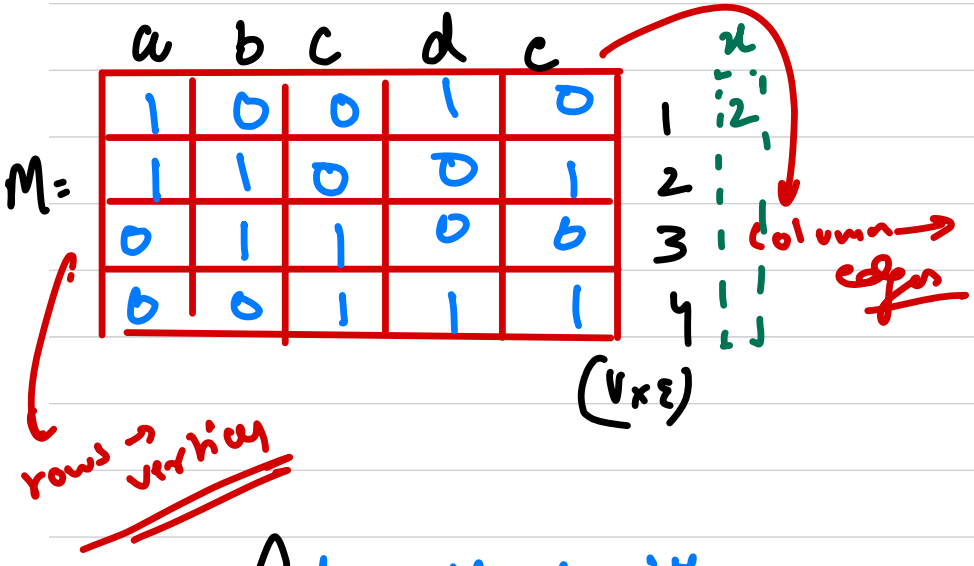
array of hashmap

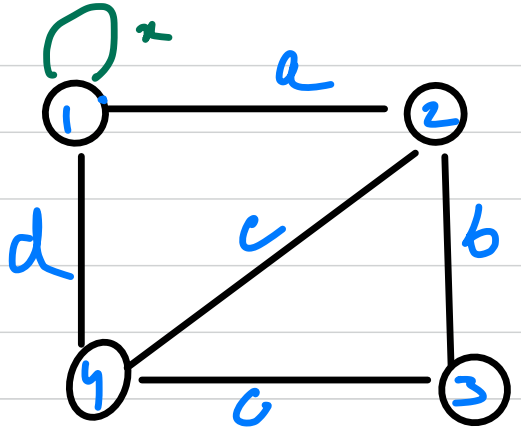
hasedge (u,v) → O(1)

Incidence Matrix

$V = \{1, 2, 3, 4\}$

$E = \{a, b, c, d, e\}$





$(V \times E)$ dimension

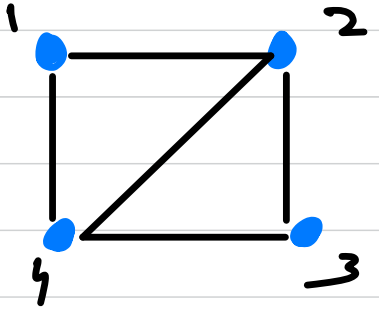
$$M_{ij} = \begin{cases} 1 & \text{if the } i^{th} \text{ vertex belongs to the } j^{th} \text{ edge.} \\ 0 & \text{else} \end{cases}$$

rows_sum = degree

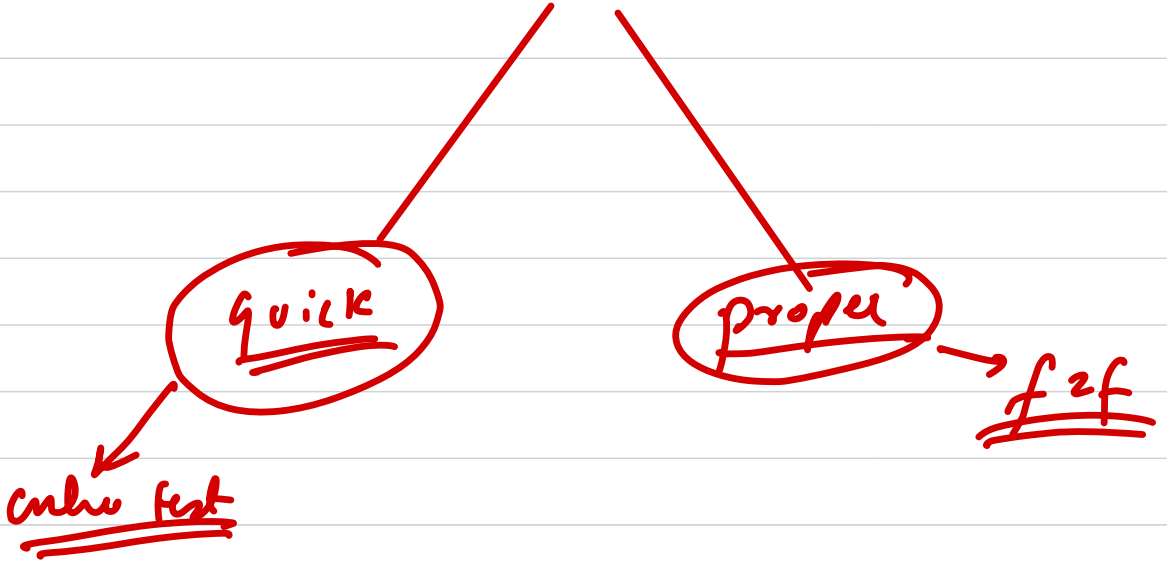
column_sum = 2

Q → What is a degree ??

Degree of a vertex in a graph G, is the total no. of edges incident to it / associated with it (undirected graphs)

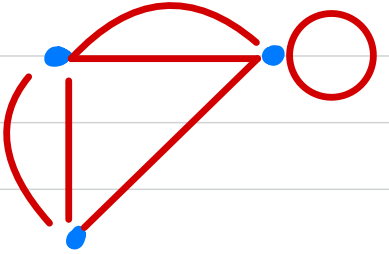


#note → In a directed graph, the outdegree of a vertex is total no. of outgoing edges & indegree is total no. of incoming edges.



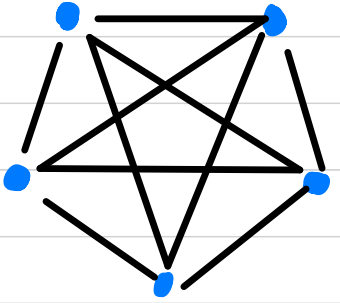
Quick
proper
f2f
online test

Multi graph → an undirected graph with multiple edges and loops allowed.



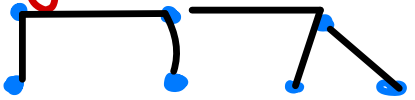
Simple Graph → An undirected graph in which both multiple edge & loops are not allowed.

Complete Graph → A graph in which every vertex is directly connected to every other vertex.

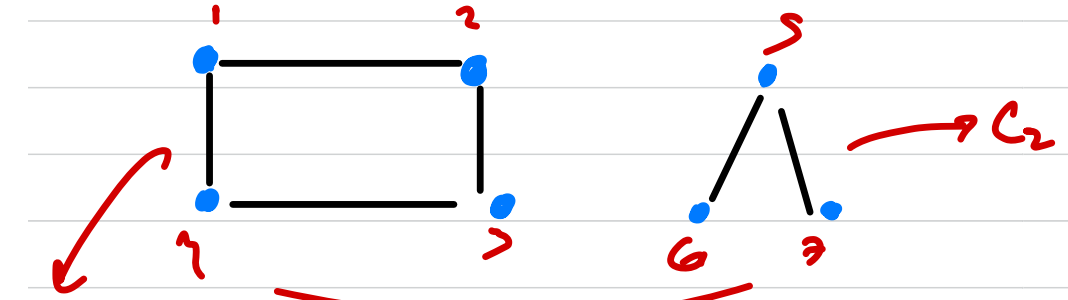


↙ complete graph

Connected graph → A connected graph has a path from every vertex to other vertex, not necessarily direct.



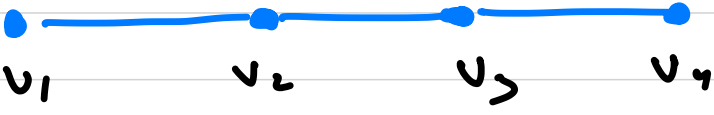
Disconnected graph → at least 2 vertices not have a path to every other vertex.



$C_1 = (\{1,2,3,4,5,6,7\}, \{\{1,2\}\{2,3\}\{3,4\}\{4,1\}\{5,6\}\{6,7\}\})$

component → a subset of a disconnected / connected graph which is connected.

path → A path P_n is a graph whose vertices can be arranged in some sequence



$V = \{ v_1 \; v_2 \; v_3 \; v_4 \}$

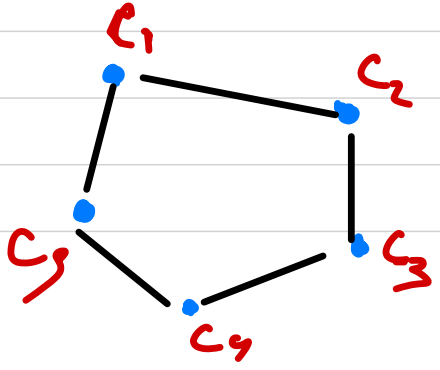
such that edge set of a graph is

$$E = \{ v_i v_{i+1} \quad \forall \; i \in [1, n-1] \}$

Cycle → A cycle C_n is a graph whose vertices can be arranged in a cycle sequence

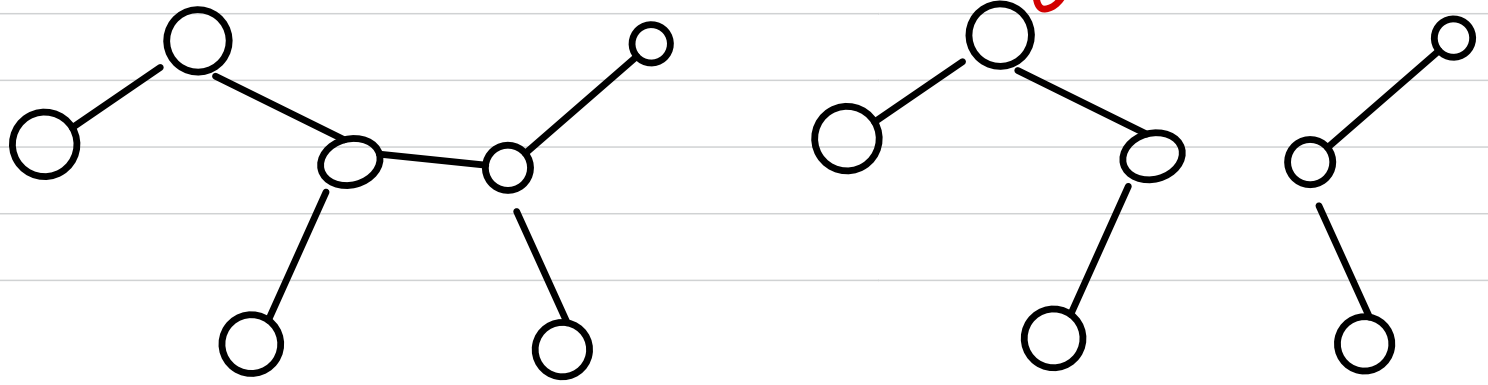
$V = \{v_1\ v_2\ v_3\ v_4\ \ldots\ v_n\}$ Such that edge set is

$$E = \{v_i v_{i+1} \quad \forall i \in [1, n-1]\} \cup \{v_1 v_n\}$$

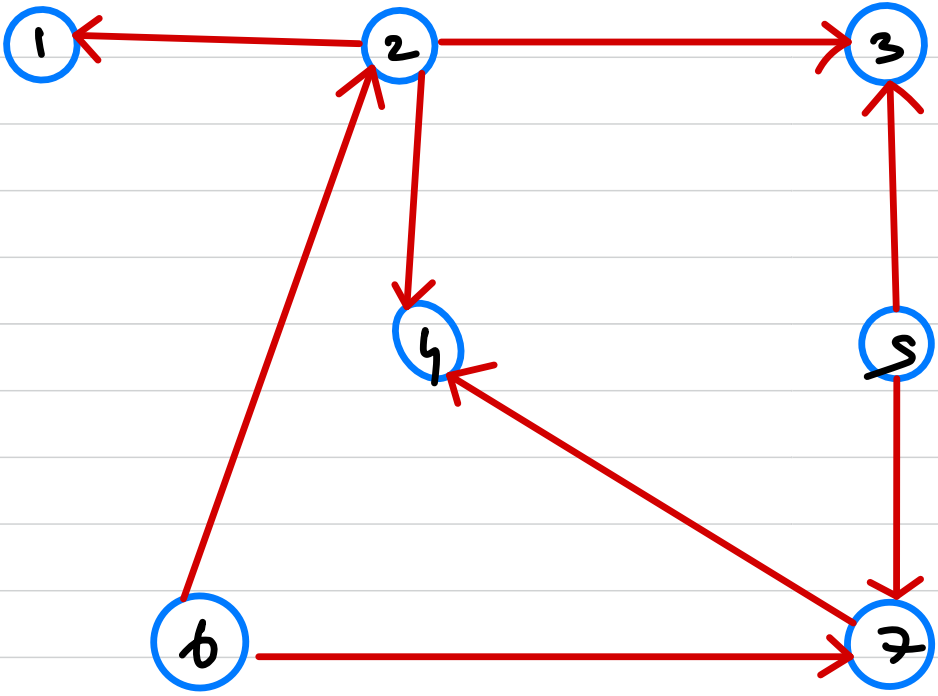


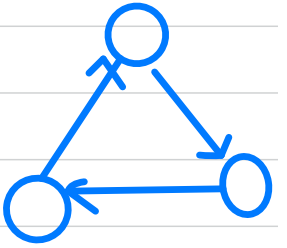
TREE → Tree is a connected graph with no cycles.

forest → If we remove an edge from tree, we get a forest viz collection of trees.



DAG (Directed acyclic graph)





not a dag

How to Read Graphs

As graphs are non-linear, we need some mechanism to read graphs.

Graph Traversals

1. Depth first search
2. Breadth first search

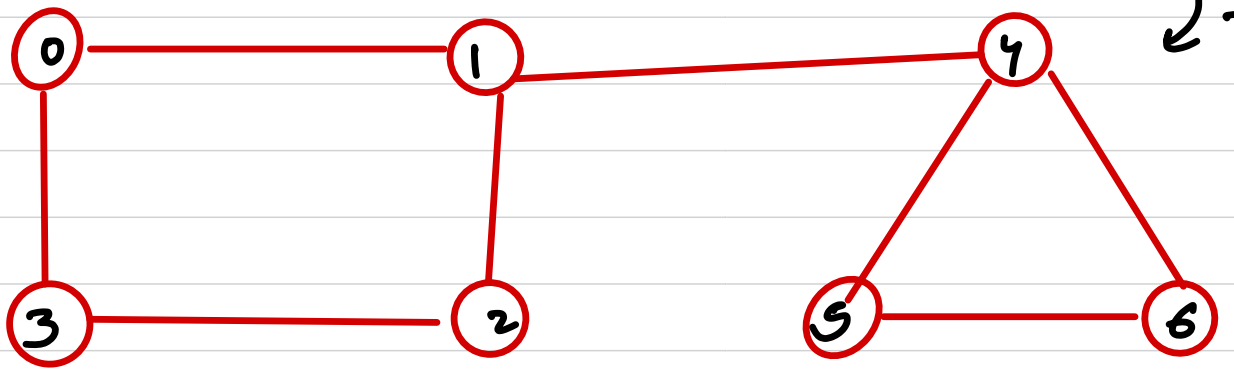
Depth first Search

Motivation problem:

Given a graph calculate all paths between 2 vertices

OR

Given a graph check whether there is a path between any 2 vertices.



G

is there a path from 0 to 5 ??

What is the most correct query for this ??

→ neighbours

path always exist for immediate neighbour

$f(u, v)$ = ?

whether there is a path from u to v.

$$f(u,v) = \begin{cases} f(n_1, v) \\ \text{or} \\ f(n_2, v) \\ \text{or} \\ f(n_3, v) \\ \vdots \\ f(n_k, v) \end{cases}$$

O(V!)

Q=1 You are given an undirected tree with v vertices. The vertices can be of any one of the following colors : Red, Blue, Black. Tree contains atleast one red and one Blue node. You can remove an edge such that we get 2 trees where none of the tree has both red and blue color nodes together. Find how many such edges we can remove.

$V \leq 3 \times 10^5$

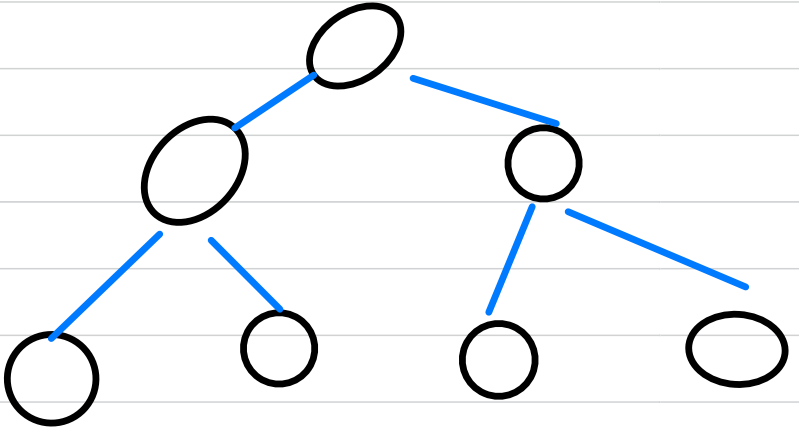
Tree → V nodes

edges ??



Prove that a tree with n nodes has n-1 edges.

PMI → assume $f(n) \rightarrow n-1$

$f(n)$ → no. of edges for n nodes.

$f(1) \rightarrow 0$

$f(2) \rightarrow 1$

Base Case

assume $f(n) \rightarrow$ true

To prove $f(n+1)$

no. of edges will be $(n-1)$ + no. of edges required for $(n+1)^{th}$ node.

Every node that will be added to a tree needs one edge.

$$f(n+1) = f(n) + 1$$
$$= (n-1) + 1 \Rightarrow (n+1) - 1$$

$f(n) = n-1$ H.P.
