

Q2) GSS1 (SPOT)

Segment
Tree

$q \rightarrow (x, y)$

↓
maximum

Sum
Subarray
in this
range

To get ans of just LST
or just RST,
we need maxsum
sub of LST & RST

{ maxsum
maxprofit
maxsuffer sum
sum of segment
}

$$\text{maxsum}_{\text{root}} = \left\{ \begin{array}{l} \text{maxsum} - \text{LST}, \text{maxsum} - \text{RST}, \\ \text{maxsum}_{\text{suffer}} - \text{LST} + \text{maxsum}_{\text{profit}} - \text{RST} \end{array} \right\}$$

1 \rightarrow for any parent segment, our max sum sub.
can be coming either from just the LST
or just the RST or both.

Q → 2 v 3 (Hacker earth)

Type 0 → l, r → decimal value of string (l..r) %3

Type 1 → make 0 → 1

$$(a+b) \% c \rightarrow (a \% c + b \% c) \% c$$

$$(a-b) \% c \rightarrow (a \% c - b \% c + c) \% c$$

$$(a * b) \% c \rightarrow (a \% c * b \% c) \% c$$

$$110 \rightarrow 1x2^2 + 1x2^1 + 0x2^0 \rightarrow x$$

$$101 \rightarrow 1x2^2 + 0x2^1 + 1x2^0 \rightarrow y$$

$$101110 \rightarrow 1x2^5 + 0x2^4 + 1x2^3 + 1x2^2 + 1x2^1 + 0x2^0 \rightarrow z$$

$$z = \overset{(\text{den-bin } x)}{2} \times y + x$$

$$= 2^3 (1x2^2 + 0x2^1 + 1x2^0) + 1x2^2 + 1x2^1 + 0x2^0$$

$$z \Rightarrow 1x2^5 + 0x2^4 + 1x2^3 + 1x2^2 + 1x2^1 + 0x2^0$$

≡

Qⁿ You are given an integer array. We define a term, inversion pair. $(a[i] > a[j] \text{ and } i < j)$

Given this array, for each element of the array, calculate the no. of inversion.

<u>result</u> →	40	10	30	50	20
	0	1	1	0	3

— 7 5 6 12 2 ↖
 0 1 1 0 4 → array
→ inversion

tree

—ve

0	0	1	0	0	1	1	0	0	0	0	1	0	0	
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14

arr

0 → value not visited
 1 → value visited

$O(n \times \log \max)$

Type 1 → update arr from 0 → 1
 Type 2 → get sum of elements after 2

Qn Given an array, you have to apply 2 queries-

a) set (i, v) $arr[i] = v$

b) first-above (x) \rightarrow find the first item greater than or equal to x . Return the value.

what if we are given
a range to perform
query

3 2 1 3 2 6 4 8

$x = 5$

→ find first value atleast x .

Can we eliminate
any subtree? →

if max of segment is $< \alpha$, then

that segment is of no use.

Print values

6 1 2 3 4 5 6 7
3, 2, 1, 2, 2, 6, 4, 8

$x=3$

$x=5$ 6

$\uparrow (\log n)$
 $O(n)$
