Real world entities use class and

objects

terminology

a) Class → It is a user defined prototype/blueprint for a real world object that defines properties of the object

b) Object → Instance → An individual real world entity that is based on the blueprint of some class.
→ unique instance of a class

Product

class

name → string
[discount] → dec
original price → int
desc → string

↪ $O(\overset{\downarrow}{O}N)$ → optimum

↪ Prefix Sums / Cumulative Sums

You have an array/list arr,

$$f(i) = \sum_{k=0}^i arr[k]$$

↓
Prefix sum
till the ith index

$f(i) \rightarrow$ prefix sum till i

$$\text{sum}(l, r) = \underbrace{f(r) - f(l) + \text{arr}[l]}_{10 - 3 + 2}$$

$Q \rightarrow \underline{\underline{010}}$
 $O(Q)$

$\Rightarrow 2 + 2$
 $\Rightarrow \underline{\underline{9}}$

Ques You have a list of size n , of all zeros.
You will get q queries & in each query
you will get 2 number l, r . You need to
increment all the element from l to r by 1

Print the final list after processing all queries

$[0, 0, 0, 0, 0]$

$n \leq 10^7$

$q \leq 10^5$

$q=3$
 $l \quad r$
 $1 \quad 3$

$2 \quad 2$

$3 \quad 4$

\rightarrow

$[0, 1, 2, 2, 1]$

ans

$[0, 0, 0, 0, 0]$

$Q \rightarrow$

read all the queries

later process all the queries at once

Start from l^{th} index
till r^{th} index increment
values

$Q \leq 10^8$
 $n \leq 10^7$

$O(Q \cdot n)$
 $O(n)$ ~~about~~
 $\leq Q \cdot n$

1, 3
2, 2
3, 4
1, 4

arr[l] += 1
arr[r+1] -= 1

0 1 2 3 4
[0, 2, 1, 0, -1]

0, 2, 3, 3, 2

prefix sum

→ prefix sum

[0, 1, 2, 2, 1]
2 3 3 2

l → is my
first affected
index

$O(p + m)$

r+1 → is my
first unaffected
index to the right
of l

Different
array
brick

$$\begin{aligned} \text{ans}[l] &= 1 \\ \text{ans}[\underbrace{\sigma+1}] &= 2 \end{aligned}$$

prefer Sm

$$\underbrace{\sigma+1} < \eta$$
